

# Geographical modelling of happiness and well-being using population surveys and remote sensing data

*Dimitris Ballas* (University of Sheffield, UK) and  
*Steffen Fritz* (International Institute for Applied  
Systems Analysis, Austria)

## ***What is happiness? Can it be measured?***

**Human perceptions of happiness vary and depend on a wide range of factors**

*What is the good life for man?* The question of what is a full and rich life cannot be answered for an individual in abstraction from the society in which he lives

(Aristotle, *Nicomachean Ethics*)

**Can happiness be measured?**

Happiness is subjective and no objective theory about the ordinary concept of happiness has the slightest plausibility

(Sumner, 1996)

# General Health Questionnaire (1)

## Have you recently:

- Been able to concentrate on whatever you are doing?
- Lost much sleep over worry?
- Felt that you are playing a useful part in things?
- Felt capable of making decisions about things?
- Felt constantly under strain?
- Felt you could not overcome your difficulties?

# General Health Questionnaire (2)

## Have you recently:

- Been able to enjoy your normal day-to-day activities?
- Been able to face up to your problems?
- Been feeling unhappy or depressed?
- Been losing confidence in yourself?
- Been thinking of yourself as a worthless person?
- Been feeling reasonably happy all things considered?

**General happiness Self Completion (4)****Question Number and Text KS1L :****Have you recently....been feeling reasonably happy, all things considered?**

| <b>Value Label</b>     | <b>%</b> |
|------------------------|----------|
| More so than usual 1   | 13.2     |
| Same as usual 2        | 72.8     |
| Less so than usual 3   | 11.8     |
| Much less than usual 4 | 2.2      |

# Multi-level modelling and spatial microsimulation

## British Household Panel Survey:

### 1991 & 2001 Census of UK population:

100% coverage

fine geographical detail

small area data

available only in tabular  
format with limited

variables to preserve  
confidentiality

sample size: more than  
5,000 households

annual surveys since  
1991

individual data

more variables than  
census

coarse geography

household attrition

## **Modelling happiness and well-being: multilevel (Ballas and Tranmer, 2007)**

1. “Null model” – extent of variation
2. Socio-economic variables and health – random intercepts
3. Social context – interaction variables

# Building geographical simulation models of happiness for “what-if” public policy analysis

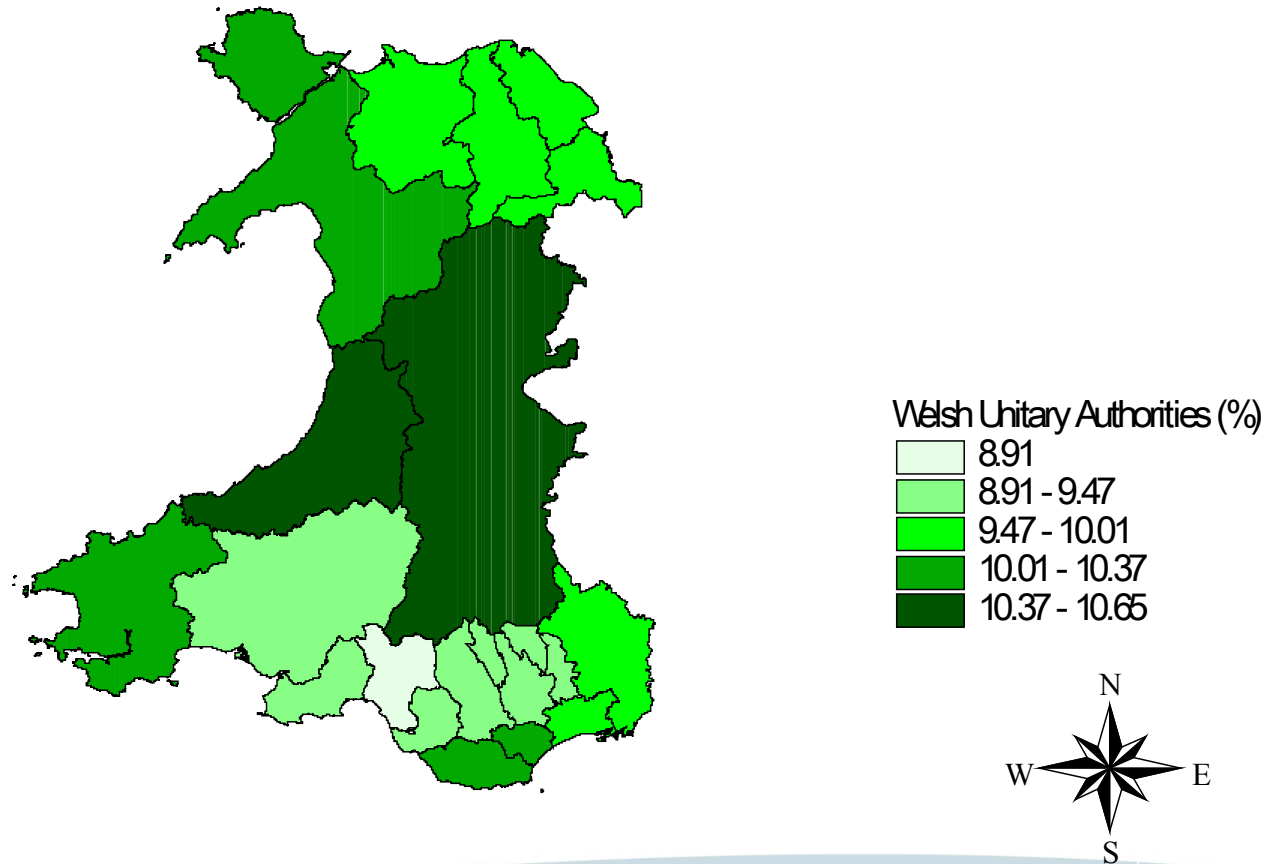

# What is microsimulation

# Combining spatial microsimulation model outputs with remote sensing data

## Spatial microsimulation output:

- No. of residents in household (as a proxy to house size)
- House type
- Number of cars (as a proxy to house size)
- Number of rooms in household space (as a proxy to house size)

## Remotely sensed data:

- land use
- property size
- house type

“visibility” data

## Remotely Sensed data

## Microsimulation model output

# Conclusions

- Towards a new framework for the combination of remotely sensed data with secondary and simulated data sets in order to provide a powerful database for the geographical analysis of subjective happiness and well-being, building on a rapidly growing body of inter-disciplinary research in this field
- Policy implications:
  - analysis of local policy outcomes
  - inform local debates on issues such as green-spaces and the geographical allocation and extent of geographical features that may be affecting happiness and local well-being.
- potential for calibration and for dynamic modelling of populations.
- Adding “environmental variables” to spatial microsimulation models and “human geography” variables to remote sensing data
